

# Energy Audits

Key to understanding how energy is being used and where cost effective improvements can be made

**FUSS & O'NEILL**  
*Disciplines to Deliver*

# Types of Energy Audits

- Ø Preliminary Audit
- Ø Single purpose or Targeted Audits
- Ø General Audit
- Ø Investment Grade Audit

# Preliminary Audit

- Ø Tour and visual inspection of the facility
- Ø Brief review of energy consumption data
- Ø Comparison to industry averages
- Ø Preliminary cost and savings estimates
- Ø Generally only identifies gross inefficiencies and waste
- Ø Not usually adequate for final decisions
- Ø Helpful in prioritizing detailed audits

# General Audit

- Ø 12 to 36 month of utility bill analysis develop detailed load profiles
- Ø Metering on some systems may be performed
- Ø In-depth interviews with operating personnel
- Ø Identifies all energy conservation measures (ECO)
- Ø Detailed financial analysis is performed for each ECO
- Ø Sufficient detail to justify project implementation.

# Investment-Grade Audit

- Ø In some organizations, both energy and non-energy investments are prioritized using a single financial criteria - Return on Investment (ROI)
- Ø Dynamic model of energy use of the existing facility and all ECOs identified
- Ø Detailed baseline are established and end use metering is utilized as required
- Ø A comprehensive financial analysis is provided for each ECO

# Ensuring High Quality Audits

## Ø Pre-Site Visit Data Collection

- *Collect data, request utility billing information, inform your Account Executive and keep Management informed*

## Ø Site Visit by your Consultant

- *Arrange for key decision makers to be present, make sure you share concerns about plant and they are understood by consultant, begin exploring/planning how to fund projects and assign a single point of contact for the consultant to work through*

## Ø Follow-Through

- *Be involved with all phases, keep management informed about ECO cost, savings and funding options*

## Ø Develop an Implementation Plan

# Energy Audit

**Energy Audits - key to understanding how energy is being used and where cost effective improvements can be made**

- Ø Collect Plant Data
  - ü *Flows, Utility bills, Operating hours, design summary, drawing and specifications*
- Ø Calculate energy consumed per million gallons of wastewater treated and compare this to similar facilities with your colleagues.
- Ø Inspect energy consuming equipment and systems, develop a list of potential energy conservation measures

# Energy Audit

- Ø Perform a preliminary cost benefit analysis
  - ü *Capital and operating costs*
  - ü *Energy and Demand savings*
  - ü *Effect on plant process, finished water quality and effluent quality*
  - ü *Paybacks*
  - ü *Availability of financing and funding after rebates if any.*
- Ø Assemble the team, discuss the opportunities and develop an implementation plan that makes sense and meets your facilities unique needs
- Ø Implement - If Technical Expertise is Not Available, Hire a Consultant

# Audit Questions

- Ø Does the process or equipment need to be Continuous ?
- Ø Can the process or systems achieve the same result at a lower flow or capacity?
- Ø Can it be run for fewer hours?
- Ø Can the operation be shifted to off-peak hours?
- Ø Are VFDs an option for variable flows or partial loading conditions?
- Ø How would enhanced controls and end use metering impact energy usage?
- Ø Do alternative technologies offer efficiency opportunities?
- Ø Would energy training help change behaviors?
- Ø Do not overlook the value of load shifting opportunities
  - ü *Expertise Required, but potential Large Savings*

# Potential WWTF ECMS

Technology	Baseline (If you have)	Potential ECM (You may want to consider)
Aeration	Coarse-Bubble Diffuser	Fine-Bubble Diffuser
	Inlet/Discharge Vane or No Control	VFD Control
	Multi-stage centrifugal blowers	Singe-stage centrifugal blower with VFD Control
	Mechanical Aeration - Constant Speed Motor	VFD Control Based on O2 Content
Pumps	Throttle, Bypass or No Control	VFD Control
	Pneumatic	Electrical-Driven
Motors	Standard Efficiency Motors	High Efficient Motors
Air Compressor	Rotary Screw with load/unload control	VFD Control

# Potential WWTF ECMS

Technology	Baseline (If you have)	Potential ECM (You may want to consider)
Dissolved Oxygen System	Manual Control	Automatic Control
Hydraulic-Driven System	Water or hydraulic-oil driven systems	Electrical-Driven System
Sludge Dewatering	Centrifuge	Screw Press
Sludge Thickening	Centrifuge Thickening System	Gravity Belt Thickening
UV Disinfection	Medium-Pressure UV System	Low-Pressure UV System

# Aeration through Fine Bubble Diffusers

Replacement of Mechanical aerators or Coarse Bubble Systems with Fine Bubble Diffusers and High Efficiency Blowers May Allow a Large Performance – Based Energy Savings Opportunity.

# Aeration through Fine Bubble Diffusers

- ∅ Higher Oxygen Transfer Efficiency
- ∅ Coverage of Larger Area Increase Mixing and Oxygen Transfer
- ∅ Potential Large Energy Savings

# Aeration through Fine Bubble Diffusers

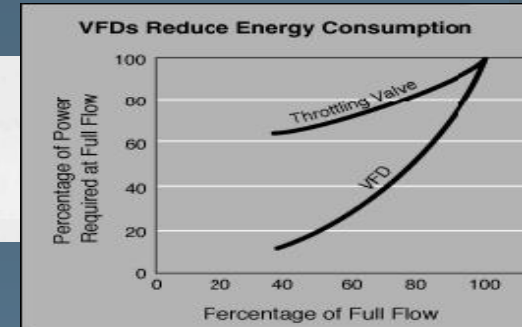

- Ø CT POTW – Concept Project – currently 3 – 40 Horsepower Surface Aerators
- Ø Replacement with app 60-80 Horsepower Spencer “Power Miser”
- Ø Maximize Incentives (likely 50% of installed costs)
- Ø Fund project with payments from Energy Savings
- Ø Energy Upgrade – to be Delivered Far in Advance of major Nutrient-removal Capital project

# Aeration through Fine Bubble Diffusers

- Ø N-P Removal Project at least 5 years out, vulnerable to SRF availability
- Ø ESCO Blower / Diffused Aerator Delivery possible in 2007 – 1Q2008
- Ø Energy Savings – immediate cost savings – ROI greater than 30 percent

# VFD Motor controller matches motor speed to load

## Possible Applications

Particularly suited for pumping and aeration - large energy draws in WWT

Should be considered when flow-restricting valves or moveable air vanes are used for flow control

Existing pumps and blowers that use throttling devices can be retrofit with VFDs

## Some Benefits

Offers a "soft start" capability

More precise control of processes such as water distribution, aeration and chemical feed

25 HP at 100% 23 hrs/day vs. 2 hrs at 100%; 8 hrs at 75%; 8 hrs at 67%; 5 hrs at 50% VFD can reduce energy use by 45%

# Motors and Motor System

## Pumps - Fans - Compressed Air - Drives

- Ø *Pump and blower motors account for 80 to 90% of the energy costs in wastewater treatment facilities.*
- Ø *EE motors are up to 10% more efficient than standard motors.*
- Ø *Lifetime energy costs to run a continuous-duty motor are 10 to 20 times higher than the original motor purchase price- think life cycle costs.*
- Ø *EE motors should be considered for all new installations, replacement of failed motors and spares.*
- Ø *They are frequently a cost-effective alternative to rewinding.*
- Ø *Most times are a cost effective substitute for operating high-duty applications motors.*
- Ø *Generally have longer insulation and bearing lives, lower heat output and less vibration*

## Replace Hydraulic Drives

- Ø Electric motors are usually an excellent replacement for water or hydraulic-oil driven equipment.
- Ø Energy is wasted in the 3 conversion steps; electric to mechanical to hydraulic and back to mechanical before it performs actual work.
- Ø Other benefits include, better control, less maintenance
- Ø Energy saving can approach 20% or greater.

# Energy Management

**Know where and how it is used**

**Make the cost effective changes required to use it more efficiently**

**Use it when it's least expensive, if possible**

**Take advantage of incentives, rebates and innovative funding opportunities**

**Save**
